

Online Art Gallery Management System Documentation

INTRODUCTION

This document outlines the key artifacts for the Online Art Gallery Management System, providing a comprehensive overview of its functionalities and underlying structure. The system aims to create an online platform for artists to showcase and sell their artwork, while allowing customers to browse, discover, and purchase art conveniently.

ARTIFACTS

1. Use Case Diagram:

Insert a simple Use Case Diagram illustrating Actors and Use Cases interacting with the Online Art Gallery Management System.

2. Use Case Specifications:

- **Use Case 1:** Browse Art (Detailed specification as described previously)
- **Use Case 2:** Manage Art (Admin/Artist) (Detailed specification as described previously)
- **Use Case 3:** Purchase Art (Detailed specification as described previously)

3. Architecture Diagram:

Insert a diagram outlining the high-level architecture with components, interactions, and dependencies as described previously.

4. Domain Model:

A description of the core entities, multiplicities, associations, and attributes as described previously.

SIGNIFICANCE OF EACH ARTIFACT

- **Use Case Diagram:** Provides a visual representation of the system's functionality from the perspective of different users (actors) and the actions they can perform (use cases).
- **Use Case Specifications:** Offer detailed descriptions of each use case, outlining the actors involved, preconditions, main flow of events, postconditions, alternate flows, and additional considerations. These specifications ensure clarity and consistency in system behavior.
- **Architecture Diagram:** Illustrates the high-level structure of the system, including its major components (presentation layer, business logic layer, data layer, and optional payment gateway), their interactions, and dependencies. This diagram helps understand how different parts of the system work together.
- **Domain Model:** Defines the core entities (users, artwork, orders - optional) and their relationships within the system. It specifies the attributes of each entity and how they are connected. This model provides a foundation for data representation and manipulation within the system.
